## Kinetic Energy

## Video Tutorial

http://youtu.be/vru-7jCo3cQ

## Examples:

1. A 6000 kg transport truck is moving at $25 \mathrm{~m} / \mathrm{s}$. Calculate the kinetic energy of the transport truck.
2. How fast would Dan have to run $(\mathrm{m}=70 \mathrm{~kg})$ in order to have the same amount of kinetic energy as the truck in part 1?
3. A 1200 kg car is travelling on the highway at a specific unknown speed. The driver presses the gas pedal doing $10,000 \mathrm{~J}$ of work on the car accelerating it to a speed of $50 \mathrm{~m} / \mathrm{s}$. Calculate the initial speed of the car.
