

Waves at Boundaries Investigation

We've observed a few things about mechanical waves so far:

1. They travel through a medium
2. They travel at a constant speed in a uniform medium
3. The speed of the wave depends on the type of material/medium it is traveling in and the "tension" of the medium. The speed does not depend on the *size or amplitude* of the wave.

What Happens to Waves When they Reach a Boundary?

WAVE REFLECTION FROM A SOLID BOUNDARY:

What Happens When Two Waves Interact With One Another?

Produce pulses simultaneously from both ends of the slinky such that they will meet at about the center and **ON THE OPPOSITE SIDE OF THE SLINKY?**

BEFORE INTERFERENCE:

DURING INTERFERENCE:

AFTER INTERFERENCE:

Type of interference:

Repeat the investigation, this time with pulses ON THE **SAME** SIDE OF THE SLINKY.

BEFORE INTERFERENCE:

DURING INTERFERENCE:

AFTER INTERFERENCE:

Type of Interference:

What Happens if a Wave Passes from One Medium Into Another Medium?

Sketch the interaction of a wave when it is incident on a boundary.
